Jendrik Stelzner May 20, 2019

Differential Graded Hopf Algebras I

In the following k denotes a field. All vector spaces, algebras, tensor products, etc. are over k, unless otherwise stated. All occurring maps are linear unless otherwise stated. Additional constraints on $\operatorname{char}(k)$ are made explicit when used.

1. Preliminary Notions and Notations

A dg-vector space V is the same as a chain complex, a dg-subspace the same as a chain subcomplex. The elements $v \in V_n$ are homogeneous of degree |v| = n. Whenever we write |v| the element v is assumed to be homogeneous. We always regard graded objects as differential graded objects with zero differential. We regard k as a dg-vector space concentrated in degree 0.

If V, W are dg-vector spaces then $V \otimes W$ is a dg-vector space with

$$|v \otimes w| = |v| + |w|, \qquad d(v \otimes w) = d(v) \otimes w + (-1)^{|v|} v \otimes d(w).$$

The **twist map** $\tau \colon V \otimes W \to W \otimes V$ given by

$$\tau(v \otimes w) = (-1)^{|v||w|} w \otimes v$$

is an isomorphism of dg-vector spaces. We use the Koszul-Quillen sign convention: Whenever homogeneous x, y are swapped the sign $(-1)^{|x||y|}$ is introduced. This results in an S_n -action on $V^{\otimes n}$ via morphisms of dg-vector spaces, given by

$$\sigma \cdot (v_1 \otimes \cdots \otimes v_n) = \varepsilon_{v_1, \dots, v_n}(\sigma) v_{\sigma^{-1}(1)} \otimes \cdots \otimes v_{\sigma^{-1}(n)}.$$

for homogeneous v_i . Here $\varepsilon_{v_1,\dots,v_n}(\sigma)$ is the **Koszul sign**. (See Appendix A.1.)

A map $f: V \to W$ is **graded** of **degree** d = |f| if $f(V_n) \subseteq V_{n+d}$ for all n, and Hom(V, W) is the dg-vector spaces with

$$\operatorname{Hom}(V,W)_n = \left\{ \text{graded maps } V \to W \text{ of degree } n \right\},$$

$$d(f) = d \circ f - (-1)^{|f|} f \circ d.$$

The differential d is a graded map of degree -1. If $f: V \to V'$, $g: W \to W'$ are graded maps then $f \otimes g: V \otimes V' \to W \otimes W'$ is the graded map given by

$$(f \otimes g)(v \otimes w) = (-1)^{|g||v|} f(v) \otimes g(w).$$

In particular $|f \otimes g| = |f| + |g|$.

The naive twist map $v \otimes w \mapsto w \otimes v$ is not a morphism of dg-vector spaces.

2. Differential Graded Algebras

Definition 2.1.

(1) A differential graded algebra or dg-algebra is a dg-vector space A together with morphisms of dg-vector spaces $m \colon A \otimes A \to A$ and $u \colon k \to A$ that make the following diagrams commute:

(2) The dg-algebra A is **graded commutative** if the following diagram commutes:

(3) A **morphism** of dg-algebras $f : A \to B$ is a morphism of dg-vector spaces such that the following diagrams commute:

(4) A $\operatorname{dg-ideal}$ in a $\operatorname{dg-algebra} A$ is a $\operatorname{dg-subspace}$ that is also an $\operatorname{ideal.}^2$

Definition 2.2. A graded map $\delta \colon A \to A$ for a graded algebra A is a **derivation** if

$$\delta \circ m = m \circ (\delta \otimes id + id \otimes \delta);$$

more explicitely,

$$\delta(ab) = \delta(a)b + (-1)^{|\delta||a|}a\delta(b).$$

Remark 2.3. A dg-algebra is the same as a graded algebra A (in particular |1| = 0) together with a differential d such that d(1) = 0 and

$$d(a \cdot b) = d(a) \cdot b + (-1)^{|a|} a \cdot d(b),$$

i.e. such that d is a graded derivation. (See Appendix A.2 for further remarks.)

Examples 2.4. (See Appendix A.3 for the explicit calculations)

 $^{^2\}mathrm{By}$ an "ideal" we always mean a two-sided ideal.

- (1) Every algebra A is a dg-algebra concentrated in degree 0, in particular A = k.
- (2) For any dg-vector space V the algebra structure of $\operatorname{End}_k(V)$ restricts to a dg-algebra structure on $\operatorname{End}(V) = \operatorname{Hom}(V, V)$.
- (3) If V is a dg-vector space then $T(V) = \bigoplus_{d>0} V^{\otimes d}$ is again a dg-vector space with

$$|v_1 \cdots v_n| = |v_1| + \dots + |v_n|,$$

$$d(v_1 \cdots v_n) = \sum_{i=1}^n (-1)^{|v_1| + \dots + |v_{i-1}|} v_1 \cdots d(v_i) \cdots v_n.$$

This makes $\mathrm{T}(V)$ into a dg-algebra, with multiplication given by concatination

$$(v_1 \cdots v_i) \cdot (v_{i+1} \cdots v_n) = v_1 \cdots v_n$$
.

The inclusion $V \to \mathrm{T}(V)$ is a morphism of dg-vector spaces and if $f \colon V \to A$ is any morphism of dg-vector spaces into a dg-algebra A then f extends uniquely to a morphism of dg-algebras $F \colon \mathrm{T}(V) \to A$:

The dg-algebra T(V) is the differential graded tensor algebra on V.

Proposition 2.5 (Constructions with dg-algebras). Let A, B be a dg-algebras.

(1) The tensor product $A \otimes B$ becomes a dg-algebra with

$$m_{A\otimes B}\colon A\otimes B\otimes A\otimes B \xrightarrow{\operatorname{id}\otimes \tau\otimes \operatorname{id}} A\otimes A\otimes B\otimes B \xrightarrow{m\otimes m} A\otimes B$$
$$u_{A\otimes B}\colon k\xrightarrow{\sim} k\otimes k \xrightarrow{u\otimes u} A\otimes B \ .$$

More explicitely, $1_{A \otimes B} = 1_A \otimes 1_B$ and $(a_1 \otimes b_1)(a_2 \otimes b_2) = (-1)^{|a_2||b_1|}a_1a_2 \otimes b_1b_2$.

(2) The dg-algebra A^{op} is given by $u_{A^{\text{op}}} = u_A$ and $m_{A^{\text{op}}} = m_A \circ \tau$. If \cdot denotes the multiplication in A and * the multiplication in A^{op} then more explicitly

$$1_A = 1_{A^{\text{op}}}, \qquad a * b = (-1)^{|a||b|} b \cdot a.$$

- (3) If I is a dg-ideal in A then A/I inherits the structure of a dg-algebra
- (4) If A is a dg-algebra then Z(A) is a graded subalgebra of A, B(A) is a graded ideal in Z(A) and H(A) is hence a graded algebra.

Proof. See Appendix A.4.

Warning 2.6. If $A \otimes_k B$ is the sign-less tensor product with $(a \otimes b)(a' \otimes b') = aa' \otimes bb'$ then $A \otimes B \neq A \otimes_k B$ as algebras, i.e. the underlying algebra of $A \otimes B$ is not the tensor product of the underlying algebras of A and B. The underlying algebra of A^{op} is similarly not the opposite of the underlying algebra of A.

Lemma 2.7. An ideal I in a dg-algebra A is a dg-ideal if and only if I is generated by homogeneous elements x_{α} with $d(x_{\alpha}) \in I$ for every α .

Proof. See Appendix A.5.
$$\Box$$

Definition 2.8. The **graded commutator** in a dg-algebra A is the unique bilinear extension of

$$[a,b] := ab - (-1)^{|a||b|} ba.$$

Example 2.9. Let V be a dg-vector space. The ideal

$$I := ([v, w] | v, w \in V \text{ are homogeneous})$$

is a dg-ideal in $\mathrm{T}(V)$, and the quotient $\Lambda(V) \coloneqq \mathrm{T}(V)/I$ is the **differential graded symmetric algebra** on V. (See Appendix A.6 for the explicit calculations and further remarks about $\Lambda(V)$.)

3. Differential Graded Coalgebras

Definition 3.1.

(1) A differential graded coalgebra or dg-coalgebra is a dg-vector space C together with morphisms of dg-vector spaces $\Delta \colon C \to C \otimes C$ and $\varepsilon \colon C \to k$ that make the following diagrams commute:

(2) The dg-coalgebra C is **graded cocommutative** if the following diagram commutes:

$$C \otimes C \xrightarrow{\tau} C \otimes C$$

(3) A **morphism** of dg-coalgebra $f \colon C \to D$ is a morphism of dg-vector spaces such that the following diagrams commute:

$$\begin{array}{ccc} C & \xrightarrow{f} & D & C & \xrightarrow{f} & D \\ \Delta \downarrow & & \downarrow \Delta & & \swarrow & \swarrow \\ C \otimes C & \xrightarrow{f \otimes f} & D \otimes D & & k \end{array}$$

(4) A **dg-coideal** in a dg-coalgebra C is a dg-subspace that is a coideal.³

Remark 3.2. A dg-coalgebra is the same as a graded coalgebra C together with a differential d such that ε vanishes on $B_0(C)$ and

$$\Delta(d(c)) = \sum_{(c)} d(c_{(1)}) \otimes c_{(2)} + (-1)^{|c_{(1)}|} c_{(1)} \otimes d(c_{(2)}).$$

(See Appendix A.7 for further remarks.)

Example 3.3. For any dg-vector space V the induced dg-vector space $\mathrm{T}(V)$ becomes a dg-coalgebra with the deconcatination

$$\Delta \colon \operatorname{T}(V) \to \operatorname{T}(V) \otimes \operatorname{T}(V) \,, \quad v_1 \cdots v_n \mapsto \sum_{i=0}^n v_1 \cdots v_i \otimes v_{i+1} \cdots v_n \,,$$

$$\varepsilon \colon \operatorname{T}(V) \to k \,, \quad v_1 \cdots v_n \mapsto \begin{cases} 1 & \text{if } n = 0 \,, \\ 0 & \text{otherwise} \,. \end{cases}$$

(See Appendix A.8 for the explicit calculations.)

Proposition 3.4. Let C, D be dg-coalgebras.

(1) The tensor product $C \otimes D$ is again a dg-coalgebra with

$$\Delta_{C\otimes D}(c\otimes d) = \sum_{(c),(d)} (-1)^{|c_{(2)}||d_{(1)}|} (c_{(1)}\otimes d_{(1)})\otimes (c_{(2)}\otimes d_{(2)})\,.$$

- (2) We have a co-opposite dg-coalgebra C^{cop} .
- (3) If I is a dg-coideal in C then C/I inherits a dg-coalgebra structure.
- (4) If C is a dg-coalgebra then Z(C) is a graded subcoalgebra of C, B(C) is a graded coideal in Z(C) and H(C) is hence a graded coalgebra.

Proof. See Appendix A.9.
$$\Box$$

4. Differential Graded Bialgebras

Lemma 4.1. Let B be a dg-vector space, (B, m, u) a dg-algebra and (B, Δ, ε) a dg-coalgebra. Then the following are equivalent:

- (1) Δ and ε are morphisms of dg-algebras.
- (2) m and u are morphisms of dg-coalgebras.

Proof. The same diagramatic proof as in the non-dg case (see talk 2). \Box

 $^{^3\}mathrm{By}$ "coideal" we always mean a two-sided coideal.

Definition 4.2.

- (1) If the conditions of Lemma 4.1 are satisfied then $(B, \mu, u, \Delta, \varepsilon)$ is a dg-bialgebra.
- (2) A map $f: B \to C$ is a **morphism** of dg-bialgebras if it is both a morphism of dg-algebras and of dg-coalgebras.
- (3) A **dg-biideal** is a dg-subspace that is both a dg-ideal and a dg-coideal.

Remark 4.3. The compatibility of the multiplication and comultiplication of B means

$$\Delta(bc) = \sum_{(b),(c)} (-1)^{|b_{(2)}||c_{(1)}|} b_{(1)}c_{(1)} \otimes b_{(2)}c_{(2)}.$$

Warning 4.4. A dg-bialgebra does in general *not* have an underlying bialgebra structure: The comultiplication $\Delta \colon B \to B \otimes B$ is a morphism of dg-algebras into $B \otimes B'$ but not necessarily an algebra morphism into the sign-less tensor product $B \otimes_k B$. We will see an explicit counterexample in Example 5.8.

Proposition 4.5. Let B, \mathcal{B} be dg-bialgebras.

- (1) If I is a dg-biideal in B then B/I inherits a dg-bialgebra structure.
- (2) The cycles $Z(\mathcal{B})$ form a graded sub-bialgebra of \mathcal{B} , $B(\mathcal{B})$ is a graded biideal in $Z(\mathcal{B})$ and $H(\mathcal{B})$ is hence a graded bialgebra.

Proof. See Appendix A.10

Definition 4.6. In a dg-bialgebra $B, x \in B$ is **primitive** if $\Delta(x) = x \otimes 1 + 1 \otimes x$, and

$$\mathbb{P}(B) := \{x \in B \mid x \text{ is primitive.}\}$$

Lemma 4.7. If $x, y \in B$ are primitive then [x, y] is again primitive.

Proof. See Example 6.5.

5. Differential Graded Hopf Algebras

Lemma 5.1. If C is a dg-coalgebra and A is a dg-algebra then the convolution product

$$f * g = m_A \circ (f \otimes g) \circ \Delta_C$$

on $\operatorname{Hom}_k(C,A)$ makes $\operatorname{Hom}(C,A)$ into a dg-algebra.

Proof. See Appendix A.11.

Definition 5.2.

(1) An **antipode** for a dg-bialgebra H is a convolution-inverse S to id_H in $\mathrm{Hom}(H,H)$. If H admits an antipode then it is a **dg-Hopf algebra**.

- (2) A morphism of dg-Hopf algebras is a morphism of dg-bialgebras.
- (3) A **dg-Hopf ideal** in a dg-Hopf algebra H is a dg-biideal I with $S(I) \subseteq I$.

Warning 5.3. A dg-Hopf algebra need not have an underlying Hopf algebra structure.

Remark 5.4. The antipode of a dg-Hopf algebra H is the unique morphism of dg-vector spaces $S: H \to H$ that makes the diagram

$$H \otimes H \xrightarrow{S \otimes \mathrm{id}} H \otimes H$$

$$H \xrightarrow{\Delta} k \xrightarrow{u} H$$

$$H \otimes H \xrightarrow{\mathrm{id} \otimes S} H \otimes H$$

$$(1)$$

commute. (See Appendix A.12.) This means more explicitely that

$$\sum_{(h)} S(h_{(1)}) h_{(2)} = \varepsilon(h) 1_H \quad \text{and} \quad \sum_{(h)} h_{(1)} S(h_{(2)}) = \varepsilon(h) 1_H.$$

(No additional signs occur because |S| = 0.)

Proposition 5.5. Let H, \mathcal{H} be dg-Hopf algebras.

- (1) If I is a dg-Hopf ideal in H then H/I inherits a dg-Hopf algebra structure.
- (2) The graded bialgebra $H(\mathcal{H})$ is a graded Hopf algebra with antipode $H(S_{\mathcal{H}})$. *Proof.* See Appendix A.13.

Example 5.6. Let V be a dg-vector space. The maps

$$\begin{split} V &\to \mathrm{T}(V) \otimes \mathrm{T}(V) \,, \quad v \mapsto v \otimes 1 + 1 \otimes v \,, \\ V &\to k \,, \qquad v \mapsto 0 \,, \\ V &\to \mathrm{T}(V)^\mathrm{op} \,, \qquad v \mapsto -v \end{split}$$

are morphisms of dg-vector spaces and hence induces a morphism of dg-algebras

$$\begin{split} \Delta \colon & \mathrm{T}(V) \to \mathrm{T}(V) \otimes \mathrm{T}(V) \,, \\ \varepsilon \colon & \mathrm{T}(V) \to k \,, \\ S \colon & \mathrm{T}(V) \to \mathrm{T}(V)^\mathrm{op} \end{split}$$

The maps Δ and ε are explicitly given by

$$\Delta(v_1 \cdots v_n) = \sum_{p=0}^n \sum_{\sigma \in Sh(p,n-p)} \varepsilon_{v_1,\dots,v_n}(\sigma^{-1}) v_{\sigma(1)} \cdots v_{\sigma(p)} \otimes v_{\sigma(p+1)} \cdots v_{\sigma(n)},$$

$$\varepsilon(v_1 \cdots v_n) = \begin{cases} 1 & \text{if } n = 0, \\ 0 & \text{otherwise}, \end{cases}$$

$$S(v_1 \cdots v_n) = (-1)^{\sum_{1 \le i < j \le n} |v_i| |v_j|} (-1)^n v_n \cdots v_1$$

for homogeneous v_i , when S is viewed as a map $T(V) \to T(V)$. These maps make T(V) is a dg-Hopf algebra. (See Appendix A.14 for the explicit calculations.)

Example 5.7 (Quotients of dg-Hopf algebras). Let V be a dg-vector space. The dg-algebra $\Lambda(V) = \mathrm{T}(V)/I$ from Example 2.9 inherits from $\mathrm{T}(V)$ the structure of a dg-Hopf algebra because the dg-ideal

$$I = ([v, w] | v, w \in V \text{ are homogeneous})$$

is a dg-Hopf ideal in T(V) (see Appendix A.15).

Example 5.8 (Exterior Algebra). Let V be a vector space. We regard V as a dg-vector space concentrated in degree 1. Then $\Lambda(V) = \bigwedge(V)$ as graded algebras whence $\bigwedge(V)$ is a graded Hopf algebra. But for char $k \neq 2$ there exists no bialgebra structure on $\Lambda := \bigwedge(V)$ (see Appendix A.16).

Example 5.9 (Homology of dg-Hopf algebras). Let V be a dg-vector space.

(1) The inclusion $V \to \mathrm{T}(V)$ is a morphism of dg-vector spaces and thus induces a morphism of graded vector spaces $\mathrm{H}(V) \to \mathrm{H}(\mathrm{T}(V))$, which in turn induces a morphism of graded algebras

$$\alpha \colon \mathrm{T}(\mathrm{H}(V)) \to \mathrm{H}(\mathrm{T}(V)), \quad [v_1] \cdots [v_n] \mapsto [v_1 \cdots v_n]$$

where $v_1, \ldots, v_n \in \mathrm{Z}(V)$. We see on representatives that α is a morphism of graded Hopf algebras. We can write α as

$$\mathrm{H}(\mathrm{T}(V)) = \mathrm{H}\!\left(\bigoplus_{d \geq 0} V^{\otimes d}\right) \cong \bigoplus_{d \geq 0} \mathrm{H}\!\left(V^{\otimes d}\right) \cong \bigoplus_{d \geq 0} \mathrm{H}(V)^{\otimes d} = \mathrm{T}(\mathrm{H}(V))$$

which shows that α is an isomorphism.

(2) If ${\rm char}(k)=0$ then also ${\rm H}(\Lambda(V))\cong \Lambda({\rm H}(V)):$ We get again a canonical morphism of graded algebras

$$\beta \colon \Lambda(H(V)) \to H(\Lambda(V)), \quad [v_1] \cdots [v_n] \mapsto [v_1 \cdots v_n]$$

where $v_1, \ldots, v_n \in \mathbf{Z}(V)$. The symmetrization map

$$s: \Lambda(V) \to \mathrm{T}(V), \quad v_1 \cdots v_n \mapsto \frac{1}{n!} \sum_{\sigma \in S_n} \sigma \cdot (v_1 \otimes \cdots \otimes v_n)$$
$$= \frac{1}{n!} \sum_{\sigma \in S_n} \varepsilon_{v_1, \dots, v_n}(\sigma^{-1}) v_{\sigma(1)} \otimes \cdots \otimes v_{\sigma(n)}$$

is a section for the projection $p: T(V) \to \Lambda(V)$ and a morphism of dg-vector spaces (see Appendix A.17). (The equality holds for homogeneous v_i .) Together with the

projection \tilde{p} : $T(H(V)) \to \Lambda(H(V))$ and symmetrization map \tilde{s} : $\Lambda(H(V)) \to T(H(V))$ we have the following diagram:

$$T(H(V)) \xrightarrow{\alpha} H(T(V))$$

$$\tilde{p} \int \tilde{s} \qquad H(p) \int H(s)$$

$$\Lambda(H(V)) \xrightarrow{\beta'} H(\Lambda(V))$$

We have $\beta = H(p) \circ \alpha \circ \tilde{s}$, and $\beta' := \tilde{p} \circ \alpha^{-1} \circ H(s)$ is an inverse to β (see Appendix A.17). This shows that β is an isomorphism.

6. Differential Graded Lie Algebras

Let char(k) = 0.

Recall 6.1. A Lie algebra is a vector space $\mathfrak g$ together with a map $[-,-]:\mathfrak g\otimes_k\mathfrak g\to\mathfrak g$ such that [-,-] is skew-symmetric and for every $x\in\mathfrak g$ the map $[x,-]:\mathfrak g\to\mathfrak g$ is a derivation; the last assertion is equivalent to the Jacobi identity $\sum_{\mathrm{cyclic}}[x,[y,z]]=0$.

Definition 6.2.

(1) A **dg-Lie algebra** is a dg-vector space \mathfrak{g} together with a morphism [-,-]: $\mathfrak{g} \otimes \mathfrak{g} \to \mathfrak{g}$ such that [-,-] is **graded skew symmetric**, i.e. such that the diagram

commutes, and such that [x, -] is for every homogeneous x a derivation of degree |x|.

(2) A dg-Lie ideal in a dg-Lie algebra \mathfrak{g} is a dg-subspace that is a Lie ideal.

Remark 6.3. That ${\mathfrak g}$ is a dg-Lie algebra means that

$$[\mathfrak{g}_{i},\mathfrak{g}_{j}] \subseteq \mathfrak{g}_{i+j},$$

$$[x,y] = -(-1)^{|x||y|}[y,x],$$

$$[x,[y,z]] = [[x,y],z] + (-1)^{|x||y|}[y,[x,z]],$$

$$d([x,y]) = [d(x),y] + (-1)^{|x|}[x,d(y)].$$
(2)

We can rewrite (2) as the **graded Jacobi identity**

$$\sum_{\text{cyclic}} (-1)^{|x||z|} [x, [y, z]] = 0.$$

Warning 6.4. A dg-Lie algebra need not have an underlying Lie algebra structure.

Example 6.5.

- (1) Every dg-algebra A becomes a dg-Lie algebra with the graded commutator.
- (2) For a graded algebra A the graded subspace $Der(A) \subseteq End(A)$ given by

$$\operatorname{Der}(A)_n := \{ \operatorname{derivations of } A \text{ of degree } n \} \subseteq \operatorname{End}(A)_n$$

is a dg-Lie subalgebra of End(A).

(3) In any dg-bialgebra B the subspace of primitive elements

$$\mathbb{P}(B) = \{ x \in B \mid \Delta(x) = x \otimes 1 + 1 \otimes x \}$$

is a dg-Lie subalgebra of B.

(See Appendix A.18 for explicit calculations.)

Lemma 6.6. Let \mathfrak{g} be a dg-Lie algebra.

- (1) If I is a dg-Lie ideal in \mathfrak{g} then \mathfrak{g}/I inherits the a dg-Lie algebra structure.
- (2) The cycles $Z(\mathfrak{g})$ form a graded Lie subalgebra of \mathfrak{g} , $B(\mathfrak{g})$ is a graded Lie ideal in $Z(\mathfrak{g})$ and $H(\mathfrak{g})$ is thus a graded Lie algebra.

П

Definition 6.7. The universal enveloping algebra of a dg-Lie algebra \mathfrak{g} is a dg-algebra $U(\mathfrak{g})$ together with a morphism of dg-Lie algebras $i \colon \mathfrak{g} \to U(\mathfrak{g})$ such that for every other dg-algebra A and every morphism of dg-Lie algebras $f \colon \mathfrak{g} \to A$ there exists a unique morphism of dg-algebras $F \colon U(\mathfrak{g}) \to A$ that extends $f \colon$

Proposition 6.8. Every dg-Lie algebra $\mathfrak g$ admits a universal enveloping algebra. It is unique up to unique isomorphism and can be constructed as

$$U(\mathfrak{g}) = T(\mathfrak{g})/([x,y]_{T(\mathfrak{g})} - [x,y]_{\mathfrak{g}} \mid x,y \in \mathfrak{g} \text{ homogeneous})$$

together with the composition $i \colon \mathfrak{g} \to \mathrm{T}(\mathfrak{g}) \to \mathrm{U}(\mathfrak{g})$. It inherits from $\mathrm{T}(\mathfrak{g})$ the structure of a dg-Hopf algebra.

Proof. See Appendix A.20.
$$\Box$$

We will now show that $H(U(\mathfrak{g})) \cong U(H(\mathfrak{g}))$. For this we need a version of the Poincaré-Birkhoff-Witt theorem (PBW theorem) for dg-Lie algebras, which we formulate in Appendix A.21. We will not attempt to prove this theorem here, and instead refer to [Qui69, Appendix B,Theorem 2.3] and [FHT01, §21(a)]. We will also blackbox the following consequences of the PBW theorem.

Corollary 6.9 (of the PBW theorem). Let g be a dg-Lie algebra.

- (1) The canonical map $\mathfrak{g} \to U(\mathfrak{g})$ is injective.
- (2) It holds that $\mathbb{P}(U(\mathfrak{g})) = \mathfrak{g}$.
- (3) If $s \colon \Lambda(\mathfrak{g}) \to \mathrm{T}(\mathfrak{g})$ denotes the symmetrization map from Example 5.9 then the composition

$$e \colon \Lambda(\mathfrak{g}) \xrightarrow{s} \mathrm{T}(\mathfrak{g}) \to \mathrm{U}(\mathfrak{g}), \quad x_1 \cdots x_n \mapsto \frac{1}{n!} \sum_{\sigma \in S_n} \varepsilon_{x_1, \dots, x_n}(\sigma^{-1}) x_{\sigma(1)} \cdots x_{\sigma(n)}$$

is an isomorphism of dg-vector spaces (and even of dg-coalgebra). \Box

Example 6.10 (Homology of $U(\mathfrak{g})$]). The inclusion $\mathfrak{g} \to U(\mathfrak{g})$ is a morphism of dg-Lie algebra and thus induces a morphism of graded Lie algebras $H(\mathfrak{g}) \to H(U(\mathfrak{g}))$, which is turn induces a morphism of graded algebras

$$\gamma \colon \mathrm{U}(\mathrm{H}(\mathfrak{g})) \to \mathrm{H}(\mathrm{U}(\mathfrak{g})), \quad [x_1] \cdots [x_n] \mapsto [x_1 \cdots x_n]$$

for $x_1, \ldots, x_n \in \mathcal{Z}(\mathfrak{g})$. We see on representatives that this is a morphism of dg-Hopf algebras, and it is an isomorphism:

We denote the isomorphisms $\Lambda(\mathfrak{g}) \to U(\mathfrak{g})$ and $\Lambda(H(\mathfrak{g})) \to U(H(\mathfrak{g}))$ from Corollary 6.9 by e and \tilde{e} . With the isomorphism of graded algebras

$$\beta \colon \Lambda(\mathrm{H}(\mathfrak{g})) \to \mathrm{H}(\Lambda(\mathfrak{g})), \quad [x_1] \cdots [x_n] \mapsto [x_1 \cdots x_n]$$

from Example 5.9 we get the following commutative diagram:

$$\begin{array}{ccc} \Lambda(H(\mathfrak{g})) & \xrightarrow{\sim} & U(H(\mathfrak{g})) \\ \beta & & & \downarrow^{\gamma} \\ H(\Lambda(\mathfrak{g})) & \xrightarrow{\sim} & H(U(\mathfrak{g})) \end{array}$$

The arrows e, H(e), β are isomorphisms, hence γ is one.

Remark 6.11.

- (1) If \mathcal{H} is a dg-Hopf algebra then $H(\mathbb{P}(\mathcal{H})) \cong \mathbb{P}(H(\mathcal{H}))$. (This statement can be found without proof in [Lod92, Theorem A.9].)
- (2) If H is a graded cocommutative connected dg-Hopf algebra then a version of the Cartier-Milnor-Moore theorem asserts that $H \cong U(\mathbb{P}(H))$. Together with Corollary 6.9 this results in an equivalence between the categories of dg-Lie algebras and cocommutative connected dg-Hopf algebras, see [Qui69, Appendix B,Theorem 4.5].

 $^{^4}$ The connectedness is defined in terms of the underlying dg-coalgebra, not that of the dg-algebra.

A. Calculations, Proofs and Remarks

A.1. The Koszul Sign

We have for every i = 1, ..., n - 1 a twist map

$$\tau_i \colon V^{\otimes n} \to V^{\otimes n} ,$$

$$v_1 \otimes \dots \otimes v_n \mapsto v_1 \otimes \dots \otimes \tau(v_i \otimes v_{i+1}) \otimes \dots \otimes v_n$$

$$\mapsto (-1)^{|v_i||v_{i+1}|} v_1 \otimes \dots \otimes v_{i+1} \otimes v_i \otimes \dots \otimes v_n .$$

The group S_n is generated by the simple reflections $\sigma_1, \ldots, \sigma_{n-1}$ with relations

$$\sigma_i^2 = 1 \qquad \text{for } i = 1, \dots, n-1,$$

$$\sigma_i \sigma_j = \sigma_j \sigma_i \qquad \text{for } |i-j| \ge 2,$$

$$\sigma_i \sigma_{i+1} \sigma_i = \sigma_{i+1} \sigma_i \sigma_{i+1} \quad \text{for } i = 1, \dots, n-2.$$

We check that the twist maps $\tau_1, \ldots, \tau_{n-1}$ satisfy these relations, which shows that S_n acts on $V^{\otimes n}$ such that s_i acts via τ_i : We have

$$\tau_i^2(v_1 \otimes \cdots \otimes v_n) = (-1)^{|v_i||v_{i+1}|} \tau_i(v_1 \otimes \cdots \otimes v_{i+1} \otimes v_i \otimes \cdots v_n) = v_1 \otimes \cdots \otimes v_n$$

and thus $\tau_i^2 = 1$. If $|i - j| \ge 2$ then

$$\tau_{i}\tau_{j}(v_{1}\otimes\cdots\otimes v_{n})$$

$$= (-1)^{|v_{i}||v_{i+1}|+|v_{j}||v_{j+1}|}v_{1}\otimes\cdots\otimes v_{i+1}\otimes v_{i}\otimes\cdots\otimes v_{j+1}\otimes v_{j}\otimes\cdots\otimes v_{n}$$

$$= \tau_{j}\tau_{i}(v_{1}\otimes\cdots\otimes v_{n})$$

and thus $\tau_i \tau_i = \tau_i \tau_i$. We also have

$$\tau_{i}\tau_{i+1}\tau_{i}(v_{1}\otimes\cdots\otimes v_{n})$$

$$= (-1)^{|v_{i}||v_{i+1}|}\tau_{i}\tau_{i+1}(v_{1}\otimes\cdots\otimes v_{i+1}\otimes v_{i}\otimes v_{i+2}\otimes\cdots\otimes v_{n})$$

$$= (-1)^{|v_{i}||v_{i+1}|+|v_{i}||v_{i+2}|}\tau_{i}(v_{1}\otimes\cdots\otimes v_{i+1}\otimes v_{i+2}\otimes v_{i}\otimes\cdots\otimes v_{n})$$

$$= (-1)^{|v_{i}||v_{i+1}|+|v_{i}||v_{i+2}|+|v_{i+1}||v_{i+2}|}v_{1}\otimes\cdots\otimes v_{i+2}\otimes v_{i+1}\otimes v_{i}\otimes\cdots\otimes v_{n})$$

and similarly

$$\tau_{i+1}\tau_{i}\tau_{i+1}(v_{1}\otimes\cdots\otimes v_{n})$$

$$= (-1)^{|v_{i+1}||v_{i+2}|}\tau_{i+1}\tau_{i}(v_{1}\otimes\cdots\otimes v_{i}\otimes v_{i+2}\otimes v_{i+1}\otimes\cdots\otimes v_{n})$$

$$= (-1)^{|v_{i}||v_{i+2}|+|v_{i+1}||v_{i+2}|}\tau_{i+1}(v_{1}\otimes\cdots\otimes v_{i+2}\otimes v_{i}\otimes v_{i+1}\otimes\cdots\otimes v_{n})$$

$$= (-1)^{|v_{i}||v_{i+1}|+|v_{i}||v_{i+2}|+|v_{i+1}||v_{i+2}|}v_{1}\otimes\cdots\otimes v_{i+2}\otimes v_{i+1}\otimes v_{i}\otimes\cdots\otimes v_{n}.$$

Therefore $\tau_i \tau_{i+1} \tau_i = \tau_{i+1} \tau_i \tau_{i+1}$. We now have the desired action of S_n on $V^{\otimes n}$. The twist maps τ_i are morphisms of dg-vector spaces whence S_n acts by morphisms of dg-vector spaces.

Without sign the action of S_n on $V^{\otimes n}$ would be given by

$$\sigma \cdot (v_1 \otimes \cdots \otimes v_n) = v_{\sigma^{-1}(1)} \otimes \cdots \otimes v_{\sigma^{-1}(n)}$$

(so that the tensor factor v_i it moved to the $\sigma(i)$ -th position). The above action of S_n on $V^{\otimes n}$ is hence given by

$$\sigma \cdot (v_1 \otimes \cdots \otimes v_n) = \varepsilon_{v_1, \dots, v_n}(\sigma) v_{\sigma^{-1}(1)} \otimes \cdots \otimes v_{\sigma^{-1}(n)}$$

with signs $\varepsilon_{v_1,\ldots,v_n}(\sigma) \in \{1,-1\}.$

A.2. Remark 2.3

(1) We see that there are two equivalent ways to make a graded vector space into a dg-algebra:

- (2) The graded commutativity of A means $ab = (-1)^{|a||b|}ba$. If |a| is even or |b| is even then ab = ba; if |a| is odd then $a^2 = -a^2$ and thus $a^2 = 0$ if $char(k) \neq 2$.
- (3) A morphism f of dg-algebras is the same as a morphism of the underlying graded algebras that commutes with the differentials. (No additional signs occur since |f| = 0.)

A.3. Examples 2.4

(2) It holds that $\mathrm{id}_V \in \mathrm{End}(V)_0$ and if $f,g \in \mathrm{End}(V)$ are graded maps then $f \circ g$ is again a graded map Therefore $\mathrm{End}(V)$ is a subalgebra of $\mathrm{End}_k(V)$. If $f,g \in \mathrm{End}(V)$ are homogeneous then $|f \circ g| = |f| + |g|$ so $\mathrm{End}(V)$ is a graded algebra. We see from

$$\begin{split} d(f\circ g) &= d\circ f\circ g - (-1)^{|f\circ g|}f\circ g\circ d \\ &= d\circ f\circ g - (-1)^{|f|+|g|}f\circ g\circ d \\ &= d\circ f\circ g - (-1)^{|f|}f\circ d\circ g + (-1)^{|f|}f\circ d\circ g - (-1)^{|f|+|g|}f\circ g\circ d \\ &= (d\circ f - (-1)^{|f|}d\circ f)\circ g + (-1)^{|f|}f\circ (d\circ g - (-1)^{|g|}g\circ d) \\ &= d(f)\circ g + (-1)^{|f|}f\circ d(g) \end{split}$$

and

$$d(\mathrm{id}_V) = d \circ \mathrm{id}_V - \mathrm{id}_V \circ d = d - d = 0$$

that $\operatorname{End}(V)$ is a dg-algebra.

(3) It remains to check the compatibility of the multiplication and dg-structure of T(V): It holds that $1_{T(V)} \in T(V)_0$ with $d(1_{T(V)}) = 0$. Furthermore

$$|v_1 \cdots v_n \cdot w_1 \cdots w_m| = |v_1| + \dots + |v_n| + |w_1| + \dots + |w_m|$$

= $|v_1 \cdots v_n| + |w_1 \cdots w_m|$

and

$$\begin{split} &d(v_1 \cdots v_n \cdot w_1 \cdots w_m) \\ &= \sum_{i=1}^n (-1)^{|v_1| + \dots + |v_{i-1}|} v_1 \cdots d(v_i) \cdots v_n \cdot w_1 \cdots w_m \\ &\quad + \sum_{j=1}^m (-1)^{|v_1| + \dots + |v_n| + |w_1| + \dots + |w_{j-1}|} v_1 \cdots v_n \cdot w_1 \cdots d(w_j) \cdots w_m \\ &\quad = d(v_1 \cdots v_n) \cdot w_1 \cdots w_m + (-1)^{|v_1| + \dots + |v_n|} v_1 \cdots v_n \cdot d(w_1 \cdots w_m) \\ &\quad = d(v_1 \cdots v_n) \cdot w_1 \cdots w_m + (-1)^{|v_1| + \dots + |v_n|} v_1 \cdots v_n \cdot d(w_1 \cdots w_m) \,. \end{split}$$

This shows that T(V) is indeed a dg-algebra.

Let A be another dg-algebra and $f: V \to A$ a morphism of dg-vector spaces an let $F: T(V) \to A$ be the unique extension of f to an algebra morphism, given by $F(v_1 \cdots v_n) = f(v_1) \cdots f(v_n)$. The algebra morphism F is a morphism of graded algebras because

$$|F(v_1 \cdots v_n)| = |f(v_1) \cdots f(v_n)|$$

$$= |f(v_1)| + \cdots + |f(v_n)|$$

$$= |v_1| + \cdots + |v_n|$$

$$= |v_1 \cdots v_n|.$$

It is also a morphism of dg-vector spaces because

$$d(F(v_1 \cdots v_n)) = d(f(v_1) \cdots f(v_n))$$

$$= \sum_{i=1}^n (-1)^{|f(v_1)| + \dots + |f(v_{i-1})|} f(v_1) \cdots d(f(v_i)) \cdots f(v_n)$$

$$= \sum_{i=1}^n (-1)^{|v_1| + \dots + |v_{i-1}|} f(v_1) \cdots f(d(v_i)) \cdots f(v_n)$$

$$= F\left(\sum_{i=1}^n (-1)^{|v_1| + \dots + |v_{i-1}|} v_1 \cdots d(v_i) \cdots v_n\right)$$

$$= F(d(v_1 \cdots v_n)).$$

A.4. Proposition 2.5

(3) The quotient A/I is a dg-vector space and an algebra and the compatibility of these structures can be checked on representatives.

(4) The cycles Z(A) form a graded subspace with $1 \in Z(A)$ and if $a, b \in Z(A)$ are homogeneous then

$$d(a \cdot b) = d(a) \cdot b + (-1)^{|a|} a \cdot d(b) = 0$$

and hence $ab \in Z(A)$. The boundaries B(A) form a graded subspace and if $a \in Z(A)$ and $b \in B(B)$ are homogeneous with b = d(a') then

$$b \cdot a = d(a') \cdot a = d(a \cdot a') - (-1)^{|a|} a' \cdot d(a) = d(a \cdot a')$$

and hence $ba \in B(A)$. Similarly $ab \in B(A)$.

A.5. Lemma 2.7

That I is a graded ideal if and only if it is generated by homogeneous elements is well-known, see [Lan02, IX, 2.5] or [Bou89, II.§11.3]. It remains to show that $d(I) \subseteq I$ if $d(x_{\alpha}) \in I$ for every α : The ideal I is spanned by $ax_{\alpha}b$ with $a, b \in A$ homogeneous, and

$$d(ax_{\alpha}b) = d(a)x_{\alpha}b + (-1)^{|a|}ad(x_{\alpha})b + (-1)^{|a|+|x_{\alpha}|}ax_{\alpha}d(b) \in I$$

since $x_{\alpha}, d(x_{\alpha}) \in I$.

A.6. Example 2.9

(1) The ideal I is a dg-ideal as the generators [v, w] are homogeneous and (by Example 6.5)

$$d([v,w]) = [d(v),w] + (-1)^{|v|}[v,d(w)] \in I.$$

(2) If S is any graded commutative dg-algebra and $f: V \to S$ a morphism of dg-vector spaces then f extends uniquely to a morphism of dg-algebras $F: \Lambda(V) \to S$:

$$\Lambda(V) \xrightarrow{F} S$$

$$\uparrow \qquad \qquad f$$

(3) Let A and B be two dg-algebras. If C is any other dg-algebra and if $f \colon A \to C$ and $g \colon B \to C$ are two morphisms of dg-algebras whose images graded-commute, in the sense that

$$f(a)g(b) = (-1)^{|a||b|}g(b)f(a)$$

for all $a \in A$, $b \in B$, then the linear map

$$\varphi \colon A \otimes B \to C$$
, $a \otimes b \mapsto f(a)g(b)$

is again a morphism of dg-algebras. The inclusions $i: A \to A \otimes B$, $a \mapsto a \otimes 1$ and $j: B: B \to A \otimes B$, $b \mapsto 1 \otimes b$ are morphisms of dg-algebras. For every

morphism of dg-algebras $\varphi \colon A \otimes B \to C$ the compositions $\varphi \circ i \colon A \to A \otimes B$ and $\varphi \colon j \colon B \to A \otimes B$ are again morphisms of dg-algebras. This gives a one-to-one correspondence

$$\begin{cases} \text{morphisms of dg-algebras} \\ f \colon A \to C, \, g \colon B \to C \\ \text{whose images graded-commute} \end{cases} \longleftrightarrow \begin{cases} \text{morphisms of dg-algebras} \\ \varphi \colon A \otimes B \to C \end{cases} ,$$

$$(f,g) \longmapsto (a \otimes b \mapsto f(a)g(b)) \, ,$$

$$(\varphi \circ i, \varphi \circ j) \longleftrightarrow \varphi \, .$$

(4) It follows for any two dg-vector spaces V and W that

$$\Lambda(V \oplus W) \cong \Lambda(V) \otimes \Lambda(W)$$

since we have for every dg-algebra A natural bijections

{morphisms of dg-algebras $\Lambda(V \oplus W) \to A$ }

- $\cong \{\text{morphisms of dg-vector spaces } V \oplus W \to A\}$
- $\cong \{(f,g) \mid \text{morphisms of dg-vector spaces } f \colon V \to A, \, g \colon W \to A\}$
- $\cong \{(\varphi, \psi) \mid \text{morphisms of dg-algebras } \varphi \colon \Lambda(V) \to A, \psi \colon \Lambda(W) \to A\}$
- $\cong \{\text{morphisms of dg-algebras } \Lambda(V) \otimes \Lambda(W) \to A\}.$

More explicitely, the inclusions $V \to V \oplus W$ and $W \to V \oplus W$ induce morphisms of dg-algebras $\Lambda(V) \to \Lambda(V \oplus W)$ and $\Lambda(W) \to \Lambda(V \oplus W)$ that give an isomorphism of dg-algebras

$$\Lambda(V) \otimes \Lambda(W) \xrightarrow{\sim} \Lambda(V \oplus W)$$
, $v_1 \cdots v_n \otimes w_1 \cdots w_m \mapsto v_1 \cdots v_n w_1 \cdots w_m$.

(5) Let V be a graded vector space. If V is concentrated in even degrees then $\Lambda(V) = S(V)$ and if V is concentrated in odd degrees then $\Lambda(V) = \bigwedge(V)$, with the grading of $\Lambda(V)$ and $\bigwedge(V)$ induced by the one of V. We have $V = V_{\text{even}} \oplus V_{\text{odd}}$ as graded vector spaces where $V_{\text{even}} = \bigoplus_n V_{2n}$ and $V_{\text{odd}} = \bigoplus_n V_{2n+1}$, and hence

$$\Lambda(V) = \Lambda(V_{\text{even}} \oplus V_{\text{odd}}) \cong \Lambda(V_{\text{even}}) \otimes \Lambda(V_{\text{odd}}) = S(V_{\text{even}}) \otimes \bigwedge(V_{\text{odd}})$$

The graded algebra $S(V_{\text{even}})$ is concentrated in even degree and so it follows that in the tensor product $S(V_{\text{even}}) \otimes \bigwedge (V_{\text{odd}})$ the simple tensors (strictly) commute, i.e. $(a \otimes b)(a' \otimes b) = aa' \otimes bb'$. Hence

$$\Lambda(V) \cong S(V_{\text{even}}) \otimes_k \bigwedge (V_{\text{odd}})$$

where \otimes_k denotes the sign-less tensor product.

(6) Let $\operatorname{char}(k) \neq 2$ and let V be a dg-vector space with basis $(x_{\alpha})_{\alpha \in A}$ consisting of homogeneous elements such that (A, \leq) is linearly ordered. Then $\Lambda(V)$ admits as a basis the ordered monomials

$$x_{\alpha_1}^{n_1} \cdots x_{\alpha_t}^{n_t}$$
 where $t \geq 0$, $\alpha_1 < \cdots < \alpha_t$, $n_i \geq 1$ and $n_i = 1$ if $|x_{\alpha_i}|$ is odd.⁵

To see this we use the above decomposition

$$\Lambda(V) \cong S(V_{\text{even}}) \otimes_k \bigwedge (V_{\text{odd}})$$
(3)

as graded algebras: We may split up the given basis $(x_{\alpha})_{\alpha \in A}$ of V into a basis $(x_{\alpha})_{\alpha \in A'}$ of V_{even} and $(x_{\alpha})_{\alpha \in A''}$ of V_{odd} (since all x_{α} are homogeneous). Then $S(V_{\text{even}})$ has as a basis the ordered monomials

$$x_{\alpha_1}^{n_1} \cdots x_{\alpha_r}^{n_r}$$
 where $r \ge 0$, $\alpha_1 < \cdots < \alpha_r$ and $n_i \ge 1$,

and $\bigwedge(V_{\text{odd}})$ has as a basis the ordered wedges

$$x_{\alpha_1} \wedge \cdots \wedge x_{\alpha_s}$$
 where $s \ge 0$, $\alpha_1 < \cdots < \alpha_s$.

It follows that with (3) that $\Lambda(V)$ admits the basis

$$x_{\alpha_1}^{n_1} \cdots x_{\alpha_r}^{n_r} \cdot x_{\beta_1} \cdots x_{\beta_s}$$
 where
$$\begin{cases} r, s \geq 0, n_i \geq 1, \\ \alpha_1 < \cdots < \alpha_r, \\ \beta_1 < \cdots < \beta_s, \\ |x_{\alpha_i}| \text{ even, } |x_{\beta_i}| \text{ odd} \end{cases}$$

We can now rearrange these basis vectors into the desired form becaus the factors $x_{\alpha_i}^{n_i}$ and x_{β_j} commute.

A.7. Remark 3.2

(1) The graded cocommutativity of C means

$$\sum_{(c)} c_{(1)} \otimes c_{(2)} = \sum_{(c)} (-1)^{|c_{(1)}||c_{(2)}|} c_{(2)} \otimes c_{(1)}.$$

- (2) A morphism of dg-coalgebras is the same as a morphism of the underlying graded coalgebras that commutes with the differentials.
- (3) Every coalgebra C is a dg-coalgebra centered in degree 0, in particular C = k.

⁵The condition $n_i = 1$ for $|x_{\alpha_i}|$ odd commes from the equality $\alpha_i^2 = [\alpha_i, \alpha_i]/2$.

A.8. Example 3.3

We have seen in a previous talk that $(T(C), \Delta, \varepsilon)$ is a coalgebra. We have for every $i = 0, \ldots, n$ that

$$|v_1 \cdots v_i \otimes v_{i+1} \cdots v_n| = |v_1 \cdots v_i| + |v_{i+1} \cdots v_n|$$

$$= |v_1| + \cdots + |v_i| + |v_{i+1}| + \cdots + |v_n|$$

$$= |v_1| + \cdots + |v_n|,$$

so we have a graded coalgebra. We also have

$$\begin{split} &d(\Delta(v_1\cdots v_n))\\ &= \sum_{i=0}^n d(v_1\cdots v_i\otimes v_{i+1}\cdots v_n)\\ &= \sum_{i=0}^n \left(d(v_1\cdots v_i)\otimes v_{i+1}\cdots v_n+(-1)^{|v_1\cdots v_i|}v_1\cdots v_i\otimes d(v_{i+1}\cdots v_n)\right)\\ &= \sum_{i=0}^n \left(\sum_{j=1}^i (-1)^{|v_1|+\cdots +|v_{j-1}|}v_1\cdots d(v_j)\cdots v_i\otimes v_{i+1}\cdots v_n\right)\\ &+ (-1)^{|v_1\cdots v_i|}\sum_{j=i+1}^n (-1)^{|v_{i+1}|+\cdots +|v_{j-1}|}v_1\cdots v_i\otimes v_{i+1}\cdots d(v_j)\cdots v_n\right)\\ &= \sum_{i=0}^n \left(\sum_{j=1}^i (-1)^{|v_1|+\cdots +|v_{j-1}|}v_1\cdots d(v_j)\cdots v_i\otimes v_{i+1}\cdots v_n\right)\\ &+ \sum_{j=i+1}^n (-1)^{|v_1|+\cdots +|v_{j-1}|}v_1\cdots v_i\otimes v_{i+1}\cdots d(v_j)\cdots v_n\right)\\ &= \Delta\left(\sum_{j=1}^n (-1)^{|v_1|+\cdots +|v_j|}v_1\otimes \cdots \otimes d(v_j)\otimes \cdots \otimes v_n\right)\\ &= \Delta(d(v_1\cdots v_n)) \end{split}$$

which shows that Δ is a morphism of dg-vector spaces.

A.9. Proposition 3.4

- (3) The quotient C/I is a dg-vector space and a coalgebra, and the compatibility of these structures can be checked on representatives.
- (4) If $c \in \mathcal{Z}(C)$ then

$$d(\Delta(c)) = \Delta(d(c)) = \Delta(0) = 0$$

because Δ is a morphism of dg-vector spaces, and hence

$$\Delta(c) \in \mathcal{Z}(C \otimes C) = \mathcal{Z}(C) \otimes \mathcal{Z}(C)$$
.

This shows that Z(C) is a subcoalgebra of C. It is also a graded subspace of C and hence a graded subcoalgebra.

For $b \in B(C)$ with b = d(c) we have

$$\Delta(b) = \Delta(d(c)) = d(\Delta(c)) = d\left(\sum_{(c)} c_{(1)} \otimes c_{(2)}\right)$$
$$= \sum_{(c)} d(c_{(1)}) \otimes c_{(2)} + (-1)^{|c_{(1)}| |c_{(1)}| \otimes d(c_{(2)})} \in B(C) \otimes C + C \otimes B(C).$$

We also have

$$\varepsilon(b) = \varepsilon(d(c)) = d(\varepsilon(c)) = 0$$
.

This shows that B(C) is a coideal in C. It follows from the upcoming lemma that B is also a coideal in Z(C). Then B(C) is a graded coideal in Z(C) because B(C) is a graded subspace of Z(C).

Lemma A.1. Let C be a coalgebra and let B be a subcoalgebra of C. If I is a coideal in C with $I \subseteq C$ then I is also a coideal in B.

Proof. It follows from the inclusions $I \subseteq B \subseteq C$ that

$$(C \otimes I + I \otimes C) \cap (B \otimes B) = B \otimes I + I \otimes B.$$

Hence

$$\Delta(I) = \Delta(I) \cap \Delta(B) \subseteq (C \otimes I + I \otimes C) \cap (B \otimes B) = B \otimes I + I \otimes B.$$
 Also $\varepsilon_B(I) = \varepsilon_C(I) = 0.$

A.10. Proposition 4.5

- (1) It follows from Proposition 2.5 and Proposition 3.4 that B/I is a dg-algebra and dg-coalgebra. The compatibility can be checked on representatives.
- (2) It follows from Proposition 2.5 and Proposition 3.4 that $H(\mathcal{B})$ is again a dg-algebra and dg-coalgebra, and the compatibility of these structures can be checked on representatives.

A.11. Lemma 5.1

We have $1_{\operatorname{Hom}_k(C,A)} = u \circ \epsilon \in \operatorname{Hom}(C,A)_0$ because both u_A and ϵ_C are morphisms of dg-vector spaces and thus of degree 0. If $f,g \in \operatorname{Hom}(C,A)$ are graded maps then $f \otimes g$ is again a graded map and thus

$$f * g = m \circ (f \otimes g) \circ \Delta$$

is a graded map as a composition of graded maps. This shows that $\operatorname{Hom}(C,A)$ is a subalgebra of $\operatorname{Hom}_k(C,A)$.

We have

$$|f * g| = |m \circ (f \otimes g) \circ \Delta| = |m| + (|f| + |g|) + |\Delta| = |f| + |g|$$

so $\operatorname{Hom}(C,A)$ is a graded algebra with respect to the convolution product. Furthermore

$$\begin{split} &d(f*g)\\ &=d\circ (f*g)-(-1)^{|f*g|}(f*g)\circ d\\ &=d\circ m\circ (f\otimes g)\otimes \Delta-(-1)^{|f|+|g|}m\circ (f\otimes g)\circ \Delta\circ d\\ &=m\circ d_{A\otimes A}\circ (f\otimes g)\otimes \Delta-(-1)^{|f|+|g|}m\circ (f\otimes g)\circ d_{C\otimes C}\circ \Delta\\ &=m\circ (d\otimes 1+1\otimes d)\circ (f\otimes g)\otimes \Delta\\ &-(-1)^{|f|+|g|}m\circ (f\otimes g)\circ (d\otimes 1+1\otimes d)\circ \Delta\\ &=m\circ (d\otimes \mathrm{id})\circ (f\otimes g)\otimes \Delta+m\circ (\mathrm{id}\otimes d)\circ (f\otimes g)\otimes \Delta\\ &-(-1)^{|f|+|g|}m\circ (f\otimes g)\circ (d\otimes \mathrm{id})\circ \Delta\\ &=m\circ ((d\circ f)\otimes g)\otimes \Delta+(-1)^{|f|}m\circ (f\otimes (d\circ g))\otimes \Delta\\ &-(-1)^{|f|+|g|}m\circ (f\otimes g)\circ (\mathrm{id}\otimes d)\circ \Delta\\ &=m\circ ((d\circ f)\otimes g)\otimes \Delta+(-1)^{|f|}m\circ (f\otimes (d\circ g))\otimes \Delta\\ &-(-1)^{|f|}m\circ ((f\circ d)\otimes g)\circ \Delta-(-1)^{|f|+|g|}m\circ (f\otimes (g\circ d))\circ \Delta\\ &=m\circ ((d\circ f-(-1)^{|f|}f\circ d)\otimes g)\otimes \Delta\\ &+(-1)^{|f|}m\circ (f\otimes (d\circ g-(-1)^{|g|}g\circ d))\otimes \Delta\\ &=m\circ (d(f)\otimes g)\circ \Delta+(-1)^{|f|}m\circ (f\otimes d(g))\otimes \Delta\\ &=m\circ (d(f)\otimes g)\circ \Delta+(-1)^{|f|}m\circ (f\otimes d(g))\otimes \Delta\\ &=d(f)*g+(-1)^{|f|}f*d(g) \end{split}$$

because m and Δ are commute with the differentials. Hence $\operatorname{Hom}(C,A)$ is a dg-algebra with respect to the convolution product.

A.12. Remark 5.4

We need to explain why an inverse to id_H in Hom(H, H) with respect to the convolution product * is again a morphism of dg-vector spaces. For this we use the following result:

Lemma A.2. Let A be a dg-algebra and let $a \in A$ be a homogeneous unit.

- (1) The inverse a^{-1} is homogeneous of degree $|a^{-1}| = -|a|$.
- (2) If a is a cycle then so is a^{-1} .

Proof.

(1) Let d=|a| and let $a^{-1}=\sum_n a'_n$ be the homogeneous decomposition of a^{-1} . It follows from $1=ab=\sum_n aa'_n$ that in degree zero, $1=aa'_{-d}$. Thus a'_{-d} is the inverse of a, i.e. $a^{-1}=a'_{-d}\in A_{-d}$.

(2) It follows from

$$0 = d(1) = d(aa^{-1}) = d(a)a^{-1} + (-1)^{|a|}ad(a^{-1})$$

that
$$(-1)^{|a|}ad(a^{-1})=0$$
 because $d(a)=0$. Hence $d(a^{-1})=0$ as a is a unit. \square

The space $Z_0(\operatorname{Hom}(V,W))$ consists of the morphism of dg-vector spaces $V \to W$. It hence follows from Lemma A.2 that if $f \in Z_0(\operatorname{Hom}(V,W))$ admits an inverse g with respect to the convolution product that again $g \in Z_0(\operatorname{Hom}(V,W))$.

A.13. Proposition 5.5

- (1) It follows from Proposition 4.5 that H is a dg-bialgebra and the condition $S(I) \subseteq I$ ensures that S induces a morphism of dg-vector spaces $\overline{S} \colon H/I \to H/I$. The antipode condition for \overline{S} can now be checked on representatives.
- (2) The homology $H(\mathcal{H})$ is a dg-bialgebra by Proposition 4.5 and that $H(S_{\mathcal{H}})$ is an antipode can be checked on representatives.

A.14. Example 5.6

The dg-coalgebra diagrams for $(T(V), \Delta, \varepsilon)$ can be checked on algebra generators of T(V) because all arrows in these diagrams are morphisms of dg-algebras. It hence sufficies to check these diagrams for elements of V, where this is straightforward.

It remains to check the equalities

$$\sum_{(h)} S(h_{(1)}) h_{(2)} = \varepsilon(h) 1_H \quad \text{and} \quad \sum_{(h)} h_{(1)} S(h_{(2)}) = \varepsilon(h) 1_H$$

for the monomials $h = v_1 \cdots v_n$. If n = 0 then h = 1 and both equalities hold, so we consider in the following the case $n \geq 1$. Then $\varepsilon(v_1 \cdots v_n) = 0$ so we have to show that in the sums $\sum_{(h)} S(h_{(1)})h_{(2)}$ and $\sum_{(h)} h_{(1)}S(h_{(2)})$ all terms cancel out. We consider for simplicity only the sum $\sum_{(h)} S(h_{(1)})h_{(2)}$. We have

$$\Delta(v_1 \cdots v_n) = \sum_{p=0}^n \sum_{\sigma \in Sh(p, n-p)} \varepsilon_{v_1, \dots, v_n}(\sigma^{-1}) v_{\sigma(1)} \cdots v_{\sigma(p)} \otimes v_{\sigma(p+1)} \cdots v_{\sigma(n)}.$$
 (4)

Here

$$S(v_{\sigma(1)}\cdots v_{\sigma(p)}) = (-1)^p (-1)^{\sum_{1 \le i < j \le p} |v_{\sigma(i)}| |v_{\sigma(j)}|} v_{\sigma(p)} \cdots v_{\sigma(1)}$$

⁶The author hasn't actually checked the other sum.

and thus

$$(m \circ (S \otimes \mathrm{id}) \circ \Delta)(v_1 \cdots v_n)$$

$$= \sum_{p=0}^n \sum_{\sigma \in \mathrm{Sh}(p, n-p)} \varepsilon_{v_1, \dots, v_n}(\sigma^{-1})(-1)^p (-1)^{\sum_{1 \le i < j \le p} |v_{\sigma(i)}| |v_{\sigma(j)}|} \cdot v_{\sigma(p)} \cdots v_{\sigma(1)} v_{\sigma(p+1)} \cdots v_{\sigma(n)}.$$

$$(5)$$

We see that in (4) any two terms of the form

$$w_1 w_2 \cdots w_i \otimes w_{i+1} \cdots w_n$$
 and $w_2 \cdots w_i \otimes w_1 w_{i+1} \cdots w_n$

give in (5) the up to sign same term $w_i \cdots w_2 w_1 w_{i+1} \cdots w_n$. We now check that the signs differ, so that in (5) both terms cancel out. This then shows that in $(m \circ (S \otimes \mathrm{id}) \circ \Delta)(v_1 \cdots v_n)$ the two terms cancel out, so that the overall sum becomes zero.

For $1 \leq p \leq n$ and $\sigma \in \operatorname{Sh}(p, n-p)$ with $\sigma(p) < \sigma(1)$ the term associated to $v_{\sigma(1)} \cdots v_{\sigma(p)} \otimes v_{(p+1)} \cdots v_{\sigma(n)}$ is given by

$$v_{\sigma(2)}\cdots v_{\sigma(p)}\otimes v_{\sigma(1)}v_{\sigma(p+1)}\cdots v_{\sigma(n)}=v_{\tau(1)}\cdots v_{\tau(p-1)}\otimes v_{\tau(p)}\cdots v_{\tau(n)}$$

for the permuation $\omega \in \operatorname{Sh}(p-1,n-p+1)$ given by

$$\omega = \sigma \circ (1 \ 2 \cdots p)$$
,

i.e.

$$\omega(i) = \begin{cases} \sigma(i+1) & \text{if } 1 \le i \le p-1, \\ \sigma(1) & \text{if } i = p, \\ \sigma(i) & \text{if } p+1 \le i \le n. \end{cases}$$

We see from the Koszul sign rule that the signs $\varepsilon_{v_1,\dots,v_n}(\sigma^{-1})$ and $\varepsilon_{v_1,\dots,v_n}(\omega^{-1})$ differ by the factor $(-1)^{|v_{\sigma(1)}||v_{\sigma(2)}|+\dots+|v_{\sigma(1)}||v_{\sigma(p)}|}$. Therefore

$$\begin{split} &\varepsilon_{v_1,\dots,v_n}(\sigma^{-1})(-1)^p(-1)^{\sum_{1\leq i< j\leq p}|v_{\sigma(i)}||v_{\sigma(j)}|}\\ &=\varepsilon_{v_1,\dots,v_n}(\omega^{-1})(-1)^{|v_{\sigma(1)}||v_{\sigma(2)}|+\dots+|v_{\sigma(1)}||v_{\sigma(p)}|}(-1)^p(-1)^{\sum_{1\leq i< j\leq p}|v_{\sigma(i)}||v_{\sigma(j)}|}\\ &=\varepsilon_{v_1,\dots,v_n}(\omega^{-1})(-1)^p(-1)^{\sum_{2\leq i< j\leq p}|v_{\sigma(i)}||v_{\sigma(j)}|}\\ &=\varepsilon_{v_1,\dots,v_n}(\omega^{-1})(-1)^p(-1)^{\sum_{1\leq i< j\leq p-1}|v_{\omega(i)}||v_{\omega(j)}|}\\ &=\varepsilon_{v_1,\dots,v_n}(\omega^{-1})(-1)^p(-1)^{\sum_{1\leq i< j\leq p-1}|v_{\omega(i)}||v_{\omega(j)}|}\\ &=-\varepsilon_{v_1,\dots,v_n}(\omega^{-1})(-1)^{p-1}(-1)^{\sum_{1\leq i< j\leq p-1}|v_{\omega(i)}||v_{\omega(j)}|}\,. \end{split}$$

Thus the signs differ as claimed.

A.15. Example 5.7

We have

$$\begin{split} \varepsilon([v,w]) &= \varepsilon \big(vw - (-1)^{|v||w|}wv\big) \\ &= \varepsilon (vw) - (-1)^{|v||w|}wv \\ &= \varepsilon (v)\varepsilon(w) - (-1)^{|v||w|}\varepsilon(w)\varepsilon(v) \\ &= 0 \end{split}$$

as $\varepsilon(v) = \varepsilon(w) = 0$. The elements v and w are primitive whence [v, w] is primitive. Therefore

$$\Delta([v,w]) = [v,w] \otimes 1 + 1 \otimes [v,w] \in I \otimes \mathrm{T}(V) + \mathrm{T}(V) \otimes I \,.$$

Also

$$\begin{split} S([v,w]) &= S\big(vw - (-1)^{|v||w|}wv\big) \\ &= S(vw) - (-1)^{|v||w|}S(wv) \\ &= (-1)^{|v||w|}wv - vw \\ &= -\big(vw - (-1)^{|v||w|}wv\big) \\ &= -[v,w] \\ &\in I \,. \end{split}$$

A.16. Example 5.8

Suppose that there exists a bialgebra structure on $\bigwedge(V)$. Then $\varepsilon(v)^2 = \varepsilon(v^2) = 0$ and thus $\varepsilon(v) = 0$ for all $v \in V$, so $\ker \varepsilon = \bigoplus_{d \geq 1} \bigwedge^n(V) =: I$. Let $v \in V$. Then by the counital axiom,

$$\Delta(v) \equiv v \otimes 1 \pmod{\Lambda \otimes I}$$
 and $\Delta(v) \equiv 1 \otimes v \pmod{I \otimes \Lambda}$

and thus

$$\Delta(v) \equiv v \otimes 1 + 1 \otimes v \pmod{I \otimes I}.$$

It follows that

$$\Delta(v^2) \equiv (v \otimes 1 + 1 \otimes v)^2 \pmod{(v \otimes 1)(I \otimes I) + (1 \otimes v)(I \otimes I) + (I \otimes I)^2},$$

and therefore

$$\Delta(v^2) \equiv v^2 \otimes 1 + 2v \otimes v + 1 \otimes v^2 \pmod{I \otimes I^2 + I^2 \otimes I}.$$

Now $v^2 = 0$, hence

$$2v \otimes v \equiv 0 \pmod{I \otimes I^2 + I^2 \otimes I}$$
.

But $2 \neq 0$ and $v \neq 0$ hence $2v \otimes v \neq 0$ while $v \otimes v \notin I \otimes I^2 + I^2 \otimes I$, a contradiction. (This proof is taken from [MO18] and partially from [Bou89, III.§11.3]).

A.17. Example 5.9

(1) The action of S_n on $V^{\otimes n}$ is by morphism of dg-vector spaces as mentioned in Section 1 and shown in Appendix A.1. The symmetrization map

$$\tilde{s} \colon \mathrm{T}(V) \to \mathrm{T}(V), \quad v_1 \cdots v_n \mapsto \frac{1}{n!} \sum_{\sigma \in S_n} \sigma \cdot (v_1 \otimes \cdots \otimes v_n)$$

therefore results in a morphism of dg-vector spaces \tilde{s} : $T(V) \to T(V)$.⁷ It follows that the factored map $s: \Lambda(V) \to T(V)$ is again a morphism of dg-vector spaces.

(2) We observe that the diagrams

commute. Indeed, for representatives $v_1, \ldots, v_n \in \mathbf{Z}(V)$ the first diagram gives

$$[v_1] \otimes \cdots \otimes [v_n] \longmapsto [v_1 \otimes \cdots \otimes v_n]$$

$$\downarrow \qquad \qquad \downarrow$$

$$[v_1] \cdots [v_n] \longmapsto [v_1 \cdots v_n]$$

and the second diagram is given as follows:

It follows that

$$\beta \beta' = \beta \tilde{p} \alpha^{-1} H(s) = H(p) \alpha \alpha^{-1} H(s) = H(p) H(s) = id_{H(\Lambda(V))}$$

and similarly

$$\beta'\beta = \tilde{p}\alpha^{-1} H(s)\beta = \tilde{p}\alpha^{-1}\alpha\tilde{s} = \tilde{p}\tilde{s} = \mathrm{id}_{\Lambda(H(V))}$$

A.18. Example 6.5

(1) If $a, b \in A$ are homogeneous then $[a, b] = ab - (-1)^{|a||b|}ba$ is homogeneous of degree |a| + |b|, so $[A_i, A_j] \subseteq A_{i+j}$ for all i, j. Also

$$[a,b] = ab - (-1)^{|a||b|}ba = -(-1)^{|a||b|} \left(ba - (-1)^{|a||b|}ab\right) = -(-1)^{|a||b|}[b,a]$$

⁷This map is a projection of T(V) on its dg-subspace of graded symmetric tensors.

and

$$\begin{split} d([a,b]) &= d\big(ab - (-1)^{|a||b|}ba\big) \\ &= d(ab) - (-1)^{|a||b|}d(ba) \\ &= d(a)b + (-1)^{|a|}ad(b) - (-1)^{|a||b|}\big(d(b)a + (-1)^{|b|}bd(a)\big) \\ &= d(a)b + (-1)^{|a|}ad(b) - (-1)^{|a||b|}d(b)a - (-1)^{|a||b|+|b|}bd(a) \\ &= d(a)b + (-1)^{|a|}ad(b) - (-1)^{|a||d(b)|+|a|}d(b)a - (-1)^{|d(a)||b|}bd(a) \\ &= d(a)b - (-1)^{|d(a)||b|}bd(a) + (-1)^{|a|}\big(ad(b) - (-1)^{|a||d(b)|}d(b)a\big) \\ &= [d(a),b] + (-1)^{|a|}[a,d(b)] \,. \end{split}$$

We check the graded Jacobi identity for homogeneous $a, b, c \in A$. We have

$$\begin{split} [a,[b,c]] &= \left[a,bc-(-1)^{|b||c|}cb\right] \\ &= \left[a,bc\right]-(-1)^{|b||c|}\left[a,cb\right] \\ &= abc-(-1)^{|a||bc|}bca-(-1)^{|b||c|}\left(acb-(-1)^{|a||cb|}cba\right) \\ &= abc-(-1)^{|a||bc|}bca-(-1)^{|b||c|}acb+(-1)^{|a||cb|+|b||c|}cba \\ &= abc-(-1)^{|a|(|b|+|c|)}bca-(-1)^{|b||c|}acb+(-1)^{|a|(|b|+|c|)+|b||c|}cba \\ &= abc-(-1)^{|a|(|b|+|a||c|}bca-(-1)^{|b||c|}acb+(-1)^{|a|(|b|+|a||c|+|b||c|}cba \end{split}$$

and therefore

$$(-1)^{|a||c|}[a, [b, c]] = (-1)^{|a||c|}abc - (-1)^{|a||b|}bca$$

$$- (-1)^{|a||c|+|b||c|}acb + (-1)^{|a||b|+|b||c|}cba .$$

It follows that

$$\begin{split} \sum_{\text{cyclic}} (-1)^{|a||c|}[a,[b,c]] &= \sum_{\text{cyclic}} (-1)^{|a||c|} abc - \sum_{\text{cyclic}} (-1)^{|a||b|} bca \\ &- \sum_{\text{cyclic}} (-1)^{|a||c|+|b||c|} acb + \sum_{\text{cyclic}} (-1)^{|a||b|+|b||c|} cba \\ &= \sum_{\text{cyclic}} (-1)^{|b||a|} bca - \sum_{\text{cyclic}} (-1)^{|a||b|} bca \\ &- \sum_{\text{cyclic}} (-1)^{|a||c|+|b||c|} acb + \sum_{\text{cyclic}} (-1)^{|b||c|+|c||a|} acb \\ &= 0 \, . \end{split}$$

(2) The subspace $\operatorname{Der}(A)$ is by construction a graded subspace of $\operatorname{End}(A)$. Let δ , ε be graded derivations. Then for all homogeneous $a,b\in A$,

$$(\delta \varepsilon)(ab) = \delta(\varepsilon(ab))$$

$$\begin{split} &= \delta(\varepsilon(a)b + (-1)^{|\varepsilon||a|}a\varepsilon(b)) \\ &= \delta(\varepsilon(a)b) + (-1)^{|\varepsilon||a|}\delta(a\varepsilon(b)) \\ &= \delta(\varepsilon(a))b + (-1)^{|\varepsilon(a)||\delta|}\varepsilon(a)\delta(b) \\ &+ (-1)^{|\varepsilon||a|}\big(\delta(a)\varepsilon(b) + (-1)^{|\delta||a|}a\delta(\varepsilon(b))\big) \\ &= \delta(\varepsilon(a))b + (-1)^{|\varepsilon(a)||\delta|}\varepsilon(a)\delta(b) \\ &+ (-1)^{|\varepsilon||a|}\delta(a)\varepsilon(b) + (-1)^{|\delta||a|+|\varepsilon||a|}a\delta(\varepsilon(b)) \\ &= \delta(\varepsilon(a))b + (-1)^{(|\varepsilon|+|a|)|\delta|}\varepsilon(a)\delta(b) \\ &+ (-1)^{|\varepsilon||a|}\delta(a)\varepsilon(b) + (-1)^{|\delta||a|+|\varepsilon||a|}a\delta(\varepsilon(b)) \\ &= \delta(\varepsilon(a))b + (-1)^{|\delta||\varepsilon|+|\delta||a|}\varepsilon(a)\delta(b) \\ &+ (-1)^{|\varepsilon||a|}\delta(a)\varepsilon(b) + (-1)^{|\delta||a|+|\varepsilon||a|}a\delta(\varepsilon(b)) \\ &+ (-1)^{|\varepsilon||a|}\delta(a)\varepsilon(b) + (-1)^{|\delta||a|+|\varepsilon||a|}a\delta(\varepsilon(b)) \end{split}$$

It follows that

$$(-1)^{|\delta||\varepsilon|}(\varepsilon\delta)(ab) = (-1)^{|\delta||\varepsilon|}\varepsilon(\delta(a))b + (-1)^{|\varepsilon||a|}\delta(a)\varepsilon(b) + (-1)^{|\delta||\varepsilon|+|\delta||a|}\varepsilon(a)\delta(b) + (-1)^{|\delta||\varepsilon|+|\delta||a|}a\varepsilon(\delta(b))$$

and therefore

$$\begin{split} [\delta,\varepsilon](ab) &= (\delta\varepsilon - (-1)^{|\delta||\varepsilon|}\varepsilon\delta)(ab) \\ &= (\delta\varepsilon)(ab) - (-1)^{|\delta||\varepsilon|}(\varepsilon\delta)(ab) \\ &= \delta(\varepsilon(a))b + (-1)^{|\delta||\varepsilon| + |\delta||a|}\varepsilon(a)\delta(b) \\ &+ (-1)^{|\varepsilon||a|}\delta(a)\varepsilon(b) + (-1)^{|\delta||a| + |\varepsilon||a|}a\delta(\varepsilon(b)) \\ &- (-1)^{|\delta||\varepsilon|}\varepsilon(\delta(a))b - (-1)^{|\varepsilon||a|}\delta(a)\varepsilon(b) \\ &- (-1)^{|\delta||\varepsilon| + |\delta||a|}\varepsilon(a)\delta(b) - (-1)^{|\delta||\varepsilon| + |\delta||a| + |\varepsilon||a|}a\varepsilon(\delta(b)) \\ &= \delta(\varepsilon(a))b - (-1)^{|\delta||\varepsilon|}\varepsilon(\delta(a))b \\ &+ (-1)^{|\delta||a| + |\varepsilon||a|}a\delta(\varepsilon(b)) - (-1)^{|\delta||\varepsilon| + |\delta||a| + |\varepsilon||a|}a\varepsilon(\delta(b)) \\ &= \delta(\varepsilon(a))b - (-1)^{|\delta||\varepsilon|}\varepsilon(\delta(a))b \\ &+ (-1)^{|\delta||a| + |\varepsilon||a|}(a\delta(\varepsilon(b)) - (-1)^{|\delta||\varepsilon|}a\varepsilon(\delta(b))) \\ &= [\delta,\varepsilon](a)b + (-1)^{|[\delta,\varepsilon]||a|}a[\delta,\varepsilon](b) \,. \end{split}$$

This shows that $[\delta, \varepsilon] \in \operatorname{Der}(A)$, so that $\operatorname{Der}(A)$ is a graded Lie subalgebra of $\operatorname{End}(A)$. If $\delta \in \operatorname{Der}(A)$ is homogeneous then

$$d(\delta) = d \circ \delta - (-1)^{|\delta|} \delta \circ d = [d, \delta]$$

is again a graded derivation, and hence Der(A) is a dg-subspace of End(A).

(3) If $a \in \mathbb{P}(B)$ with homogeneous decomposition $a = \sum_{n} a_n$ then

$$\Delta(a) = \Delta\left(\sum_{n} a_{n}\right) = \sum_{n} \Delta(a_{n})$$

but also

$$\Delta(a) = a \otimes 1 + 1 \otimes a = \sum_{n} (a_n \otimes 1 + 1 \otimes a_n).$$

By comparing homogeneous components we see that $\Delta(a_n) = a_n \otimes 1 + 1 \otimes a_n$ for all n. This means that all homogeneous components a_n are again primitive, which shows that $\mathbb{P}(B)$ is a graded subspace of B. If $a \in \mathbb{P}(B)$ then

$$\begin{split} \Delta(d(a)) &= d(\Delta(a)) \\ &= d(a \otimes 1 + 1 \otimes a) \\ &= d(a \otimes 1) + d(1 \otimes a) \\ &= d(a) \otimes 1 + (-1)^{|a|} a \otimes d(1) + d(1) \otimes a + (-1)^{|1|} 1 \otimes d(a) \\ &= d(a) \otimes 1 + 1 \otimes d(a) \end{split}$$

because |1| = 0 and d(1) = 0. Therefore $\mathbb{P}(B)$ is a dg-subspace of B. If $a, b \in \mathbb{P}(B)$ then

$$\begin{split} \Delta(ab) &= \Delta(a)\Delta(b) \\ &= (a\otimes 1 + 1\otimes a)(b\otimes 1 + 1\otimes b) \\ &= (a\otimes 1)(b\otimes 1) + (a\otimes 1)(1\otimes b) + (1\otimes a)(b\otimes 1) + (1\otimes a)(1\otimes b) \\ &= ab\otimes 1 + a\otimes b + (-1)^{|a||b|}b\otimes a + 1\otimes ab \,. \end{split}$$

If a, b are homogeneous then it follows that

$$\begin{split} \Delta([a,b]) &= \Delta \big(ab - (-1)^{|a||b|}ba\big) \\ &= \Delta(ab) - (-1)^{|a||b|}\Delta(ba) \\ &= ab \otimes 1 + a \otimes b + (-1)^{|a||b|}b \otimes a + 1 \otimes ab \\ &- (-1)^{|a||b|} \big(ba \otimes 1 + b \otimes a + (-1)^{|a||b|}a \otimes b + 1 \otimes ba\big) \\ &= ab \otimes 1 + a \otimes b + (-1)^{|a||b|}b \otimes a + 1 \otimes ab \\ &- (-1)^{|a||b|}ba \otimes 1 - (-1)^{|a||b|}b \otimes a - a \otimes b - (-1)^{|a||b|}1 \otimes ba \\ &= \big(ab - (-1)^{|a||b|}ba\big) \otimes 1 + 1 \otimes \big(ab - (-1)^{|a||b|}ba\big) \\ &= [a,b] \otimes 1 + 1 \otimes [a,b] \end{split}$$

which shows that $[a, b] \in \mathbb{P}(B)$. Thus $\mathbb{P}(B)$ is a dg-Lie subalgebra of B.

A.19. Lemma 6.6

- (1) The quotient \mathfrak{g}/I is again a dg-vector spaces and a Lie algebra. The compatibility of these structures can be checked on generators.
- (2) The cycles $Z(\mathfrak{g})$ form a graded subspace of \mathfrak{g} . For homogeneous $x, y \in Z(\mathfrak{g})$,

$$d([x,y]) = [d(x),y] + (-1)^{|x|}[x,d(y)] = [0,y] + (-1)^{|x|}[x,0] = 0,$$

so $Z(\mathfrak{g})$ is indeed a graded Lie subalgebra of \mathfrak{g} . The boundaries $B(\mathfrak{g})$ form a graded subspace of $Z(\mathfrak{g})$. If $x \in B(\mathfrak{g})$ with x = d(x'), where $x' \in \mathfrak{g}$ is homogeneous, then for every $y \in Z(\mathfrak{g})$,

$$[x,y] = [d(x'),y] = d([x',y]) - (-1)^{|x'|}[x',\underbrace{d(y)}_{=0}] = d([x',y]) \in \mathcal{B}(\mathfrak{g}) \,.$$

Thus $B(\mathfrak{g})$ is a graded Lie ideal in $Z(\mathfrak{g})$.

A.20. Proposition 6.8

We check that the given ideal I is a dg-Hopf ideal. It is generated by homogenous elements which satisfy

$$\begin{split} &d([x,y]_{\mathrm{T}(\mathfrak{g})}-[x,y]_{\mathfrak{g}})\\ &=d([x,y]_{\mathrm{T}(\mathfrak{g})})-d([x,y]_{\mathfrak{g}})\\ &=[d(x),y]_{\mathrm{T}(\mathfrak{g})}+(-1)^{|x|}[x,d(y)]_{\mathrm{T}(\mathfrak{g})}-[d(x),y]_{\mathfrak{g}}-(-1)^{|x|}[x,d(y)]_{\mathfrak{g}}\\ &=\left([d(x),y]_{\mathrm{T}(\mathfrak{g})}-[d(x),y]_{\mathfrak{g}}\right)+(-1)^{|x|}\bigg([x,d(y)]_{\mathrm{T}(\mathfrak{g})}-[x,d(y)]_{\mathfrak{g}}\bigg)\in I \end{split}$$

so it is a dg-ideal. Also

$$\varepsilon([x,y]_{\mathrm{T}(\mathfrak{g})} - [x,y]_{\mathfrak{g}}) = \varepsilon([x,y]_{\mathrm{T}(\mathfrak{g})}) - \varepsilon([x,y]_{\mathfrak{g}}) = 0 - 0 = 0$$

because $[x, y]_{T(\mathfrak{g})}$ and $[x, y]_{\mathfrak{g}}$ are homogoneous of degree ≥ 1 ,

$$\begin{split} &\Delta([x,y]_{\mathrm{T}(\mathfrak{g})} - [x,y]_{\mathfrak{g}}) \\ &= \Delta([x,y]_{\mathrm{T}(\mathfrak{g})}) - \Delta([x,y]_{\mathfrak{g}})) \\ &= [x,y]_{\mathrm{T}(\mathfrak{g})} \otimes 1 + 1 \otimes [x,y]_{\mathrm{T}(\mathfrak{g})} - [x,y]_{\mathfrak{g}} \otimes 1 - 1 \otimes [x,y]_{\mathfrak{g}} \\ &= ([x,y]_{\mathrm{T}(\mathfrak{g})} - [x,y]_{\mathfrak{g}}) \otimes 1 + 1 \otimes ([x,y]_{\mathrm{T}(\mathfrak{g})} - [x,y]_{\mathfrak{g}}) \\ &\in I \otimes \mathrm{T}(\mathfrak{g}) + \mathrm{T}(\mathfrak{g}) \otimes I \end{split}$$

since both $[x,y]_{T(\mathfrak{q})}$ and $[x,y]_{\mathfrak{q}}$ are primitive, and finally

$$S([x,y]_{T(\mathfrak{g})} - [x,y]_{\mathfrak{g}}) = S([x,y]_{T(\mathfrak{g})}) - S([x,y]_{\mathfrak{g}}) = -[x,y]_{T(\mathfrak{g})} + [x,y]_{\mathfrak{g}} \in I.$$

Thus the dg-ideal I is already a dg-Hopf ideal.

A.21. The Poincaré-Birkhoff-Witt theorem

Recall A.3. If \mathfrak{g} is a Lie algebra with basis $(x_{\alpha})_{{\alpha}\in A}$ where (A, \leq) is linearly ordered then the PBW theorem asserts that $U(\mathfrak{g})$ has as a basis the ordered monomials

$$x_{\alpha_1}^{n_1} \cdots x_{\alpha_t}^{n_t}$$
 where $t \ge 0$, $\alpha_1 < \cdots < \alpha_t$ and $n_i \ge 1$.

This shows in particular that the Lie algebra homomorphism $\mathfrak{g} \to U(\mathfrak{g})$ is injective, and it also follows that $\mathbb{P}(U(\mathfrak{g})) = \mathfrak{g}$. Moreover, $\operatorname{gr} U(\mathfrak{g}) \cong S(\mathfrak{g})$ where $\operatorname{gr} U(\mathfrak{g})$ denotes the associated graded for the standard filtration of $U(\mathfrak{g})$.

Theorem A.4 (dg-PBW theorem). Let \mathfrak{g} be a dg-Lie algebra with basis $(x_{\alpha})_{\alpha \in A}$ consisting of homogeneous elements such that (A, \leq) is linearly ordered. Then $U(\mathfrak{g})$ has as a basis all ordered monomials

 $x_{\alpha_1} \cdots x_{\alpha_n}$ where $t \geq 0$, $\alpha_1 < \cdots < \alpha_t$, $n_i \geq 1$ and $n_i = 1$ if $|x_{\alpha_i}|$ is odd.
